## **Evolution In Changing Environments Some Theoretical Explorations Mpb 2 Monographs In Population Biology:**

**Evolution in Changing Environments** Richard Levins, 1968      **Ecological Niches and Geographic Distributions (MPB-49)** A. Townsend Peterson, 2011-11-20 Terminology conceptual overview biogeography modeling      **Geographical Genetics (MPB-38)** Bryan K. Epperson, 2003-08-31 Population genetics has made great strides in applying statistical analysis and mathematical modeling to understand how genes mutate and spread through populations over time But real populations also live in space Streams mountains and other geographic features often divide populations limit migration or otherwise influence gene flow This book rigorously examines the processes that determine geographic patterns of genetic variation providing a comprehensive guide to their study and interpretation Geographical Genetics has a unique focus on the mathematical relationships of spatial statistical measures of patterns to stochastic processes It also develops the probability and distribution theory of various spatial statistics for analysis of population genetic data detailing exact methods for using various spatial features to make precise inferences about migration natural selection and other dynamic forces The book also reviews the experimental literature on the types of spatial patterns of genetic variation found within and among populations And it makes an unprecedented strong connection between observed measures of spatial patterns and those predicted theoretically Along the way it introduces readers to the mathematics of spatial statistics applications to specific population genetic systems and the relationship between the mathematics of space time processes and the formal theory of geographical genetics Written by a leading authority this is the first comprehensive treatment of geographical genetics It is a much needed guide to the theory techniques and applications of a field that will play an increasingly important role in population biology and ecology      **Self-Organization in Complex Ecosystems. (MPB-42)** Ricard V. Solé, Jordi Bascompte, 2006-03-26 Describing a theoretical view of ecosystems based on how they self organise to produce complex patterns this book focuses on very simple models that despite their simplicity encapsulate fundamental properties of how ecosystems work      **Niche Construction** F. John Odling-Smee, Kevin N. Lala, Marcus Feldman, 2003-07-22 The seemingly innocent observation that the activities of organisms bring about changes in environments is so obvious that it seems an unlikely focus for a new line of thinking about evolution Yet niche construction as this process of organism driven environmental modification is known has hidden complexities By transforming biotic and abiotic sources of natural selection in external environments niche construction generates feedback in evolution on a scale hitherto underestimated and in a manner that transforms the evolutionary dynamic It also plays a critical role in ecology supporting ecosystem engineering and influencing the flow of energy and nutrients through ecosystems Despite this niche construction has been given short shrift in theoretical biology in part because it cannot be fully understood within the framework of standard evolutionary theory Wedding evolution and ecology this book extends evolutionary theory by formally including niche construction and ecological inheritance as additional evolutionary processes The authors support their historic move with empirical data theoretical population genetics

and conceptual models They also describe new research methods capable of testing the theory They demonstrate how their theory can resolve long standing problems in ecology particularly by advancing the sorely needed synthesis of ecology and evolution and how it offers an evolutionary basis for the human sciences Already hailed as a pioneering work by some of the world s most influential biologists this is a rare potentially field changing contribution to the biological sciences

**Population Biology** Philip W. Hedrick,1984      **Introduction to Population Biology & Evolution** Otto Thomas Solbrig,Dorothy J. Solbrig,1979      **Population Biology** K. Wöhrmann,S.K. Jain,2012-12-06 Fascinated by the diversity of living organisms humans have always been curious about its origin Darwin was the first to provide the scholarly and persuasive thesis for gradual evolution and speciation under natural selection Although we now have much information on evolution we still don t understand it in detail Many questions still remain open due to the complexity and multiplicity of interacting factors Several approaches mainly arising from population ecology and genetics are presented in this book in order to help understand genetic variation and evolution      Population Biology and Evolution Klaus Wöhrmann,Volker Loeschcke,1984      **Introduction to Population Biology** Dick Neal,2018-11-29 How do plant and animal populations change genetically to evolve and adapt to their local environments How do populations grow and interact with one another through competition and predation How does behaviour influence ecology and evolution This second edition of Dick Neal s unique textbook on population biology addresses these questions and offers a comprehensive analysis of evolutionary theory in the areas of ecology population genetics and behaviour Taking a quantitative and Darwinian perspective Neal uses mathematical models to develop the basic theory of population processes Key features in this edition include new chapters on inbreeding and species interactions and community structure a modified structure in Part II more recent empirical examples to illustrate the application of theoretical models to the world around us and end of chapter problems to help students with self assessment A series of spreadsheet simulations have also been conveniently located online for students to further improve their understanding of such models      **Adaptation and Environment** Robert N. Brandon,2014-07-14 By focusing on the crucial role of environment in the process of adaptation Robert Brandon clarifies definitions and principles so as to help make the argument of evolution by natural selection empirically testable He proposes that natural selection is the process of differential reproduction resulting from differential adaptedness to a common selective environment Originally published in 1990 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905      **Complex Population Dynamics** Peter Turchin,2003-02-02 Why do organisms become extremely abundant one year and then seem to disappear a few years later Why do population

outbreaks in particular species happen more or less regularly in certain locations but only irregularly or never at all in other locations Complex population dynamics have fascinated biologists for decades By bringing together mathematical models statistical analyses and field experiments this book offers a comprehensive new synthesis of the theory of population oscillations Peter Turchin first reviews the conceptual tools that ecologists use to investigate population oscillations introducing population modeling and the statistical analysis of time series data He then provides an in depth discussion of several case studies including the larch budmoth southern pine beetle red grouse voles and lemmings snowshoe hare and ungulates to develop a new analysis of the mechanisms that drive population oscillations in nature Through such work the author argues ecologists can develop general laws of population dynamics that will help turn ecology into a truly quantitative and predictive science Complex Population Dynamics integrates theoretical and empirical studies into a major new synthesis of current knowledge about population dynamics It is also a pioneering work that sets the course for ecology's future as a predictive science

**Population Biology and Evolution** Richard C. Lewontin, 1968 **Ecology, Evolution, and Population Biology : Readings from 'scientific American'**, 1974 *Adaptation in Metapopulations* Michael J. Wade, 2016-05-03 All organisms live in clusters but such fractured local populations or demes nonetheless maintain connectivity with one another by some amount of gene flow between them Most such metapopulations occur naturally like clusters of amphibians in vernal ponds or baboon troops spread across the African veldt Others have been created as human activities fragment natural landscapes as in stands of trees separated by roads As landscape change has accelerated understanding how these metapopulations function and specifically how they adapt has become crucial to ecology and to our very understanding of evolution itself With *Adaptation in Metapopulations* Michael J Wade explores a key component of this new understanding of evolution interaction Synthesizing decades of work in the lab and in the field in a book both empirically grounded and underpinned by a strong conceptual framework Wade looks at the role of interaction across scales from gene selection to selection at the level of individuals kin and groups In so doing he integrates molecular and organismal biology to reveal the true complexities of evolutionary dynamics from genes to metapopulations

**Introduction to Population Biology** Dick Neal, 2004 Provides a quantitative and Darwinian perspective on population biology with problem sets simulations and worked examples to aid the student **Evolutionary Biology** Theodosius Dobzhansky, Max K. Hecht, William C. Steere, 2012-12-06 1 On Some Fundamental Concepts of Darwinian Biology Vitalism Mechanism and Compositionism Adaptedness and Adaptation Adaptedness to Survive and to Reproduce Adaptability Evolutionary Plasticity The Problem of Quantification of Adaptedness Darwinian Fitness Varieties of Natural Selection Darwinian Fitness and Adaptedness Evolutionary Opportunism and Adaptive Radiation Progressive Evolution References 2 Cave Ecology and the Evolution of Troglodites Animal Life in Caves The Cave Ecosystem Regressive Evolution in Cave Animals Speciation and Adaptation in Troglodites

**Evolution and the Genetics of Populations, Volume 4** Sewall Wright, 1984-06-15 These

volumes discuss evolutionary biology through the lense of population genetics      *Evolution and the Genetics of Populations*  
Sewall Wright, 1968      Rates of Evolution K.S.W Campbell, M.F. Day, 2019-06-07 Originally published in 1987 Rates of  
Evolution is an edited collection drawn from a symposium convened to bring together palaeontologists geneticists molecular  
biologists and developmental biologists to examine some aspects of the problem of evolutionary rates The book asks  
questions surrounding the study of evolution such as did large morphological changes really occur rapidly at various times in  
the geological past or is the fossil record too imperfect to be of value in assessing rates of morphological change What is the  
measure of rapid change Is stasis at any taxonomic level established Is it possible to relate genomic and morphological  
change What is the role of regulatory and executive genes in controlling evolutionary change Does the transfer of genetic  
material between different taxa provide the possibility of increasing evolutionary rates Featuring contributions from leading  
researchers this book will interest anthropologists palaeontology and scientists of evolution and genetics
