Routledge Handbook of Energy in

Asia Subhes Bhattacharyya, 2017-10-12 The Routledge Handbook of Energy in Asia presents a comprehensive review of the unprecedented growth of Asian energy over the past quarter of a century. It provides insightful analysis into variation across the continent whilst highlighting areas of cross learning and regional cooperation between the developed and developing countries of Asia. Prepared by a team of leading international experts, this book not only captures the East Asian domination particularly that of China but also highlights the growing influence of South Asia and the ASEAN. Organised into four parts, the sections include the demand for energy in the region and its main drivers at the sector level, developments in energy supply including fossil fuels and renewable energy sources, energy policies and issues such as sector reform and climate change, the transition to a low carbon pathway. This handbook offers a complete picture of Asian energy covering supply and demand as well as contemporary challenges in the sector. As such, it is a valuable resource for students and scholars of energy policy, Environmental Studies and Asian Studies.

Energy Tax and Regulatory Policy in Europe Ian Parry, Karen Pittel, Herman Vollebergh, 2017-09-15 Concise introductions to the main issues in energy policy and their interaction with environmental policies in the EU. The European Union (EU) faces critical challenges in energy policy making, the most pressing of which are how to achieve the deep greenhouse gas reductions promised at the December 2015 UN Conference of the Parties in Paris and how this effort can be coordinated with already existing policies. Energy policy is primarily a member state responsibility and policy makers need an overarching view of the main issues in energy policy and their interaction with environmental policies. This volume aims to fill this need, offering concise introductions to some of the major issues as well as practical suggestions for policy making. The contributors discuss reforms to the EU Emissions Trading System (ETS), the world's largest carbon market; ways to improve the operation and integration of the EU's power grids in terms of both supply and demand; changes to the EU's Energy Tax Directive which sets tax floors for fuels outside the ETS; the coordination of climate policies with policies to promote renewables and energy efficiency; research into clean technology; challenges to shale gas development and transportation policy; and the need for action on such externalities as traffic congestion. Finally, contributors consider obstacles to reform, including its potential effects on vulnerable households and energy intensive industries.

The Palgrave Handbook of Managing Fossil Fuels and Energy Transitions Geoffrey Wood, Keith Baker, 2019-11-12 This Handbook is the first volume to comprehensively analyse and problem solve how to manage the decline of fossil fuels as the world tackles climate change and shifts towards a low carbon energy transition. The overall findings are straight forward and unsurprising, although fossil fuels have powered the industrialisation of many

nations and improved the lives of hundreds of millions of people another century dominated by fossil fuels would be disastrous Fossil fuels and associated greenhouse gas emissions must be reduced to a level that avoids rising temperatures and rising risks in support of a just and sustainable energy transition Divided into four sections and 25 contributions from global leading experts the chapters span a wide range of energy technologies and sources including fossil fuels carbon mitigation options renewables low carbon energy energy storage electric vehicles and energy sectors electricity heat and transport They cover varied legal jurisdictions and multiple governance approaches encompassing multi and inter disciplinary technological environmental social economic political legal and policy perspectives with timely case studies from Africa Asia Australia Europe North America South America and the Pacific Providing an insightful contribution to the literature and a much needed synthesis of the field as a whole this book will have great appeal to decision makers practitioners students and scholars in the field of energy transition studies seeking a comprehensive understanding of the opportunities and challenges in managing the decline of fossil fuels

Competitive Electricity Markets Fereidoon Sioshansi,2011-10-10 After 2 decades policymakers and regulators agree that electricity market reform liberalization and privatization remains partly art Moreover the international experience suggests that in nearly all cases initial market reform leads to unintended consequences or introduces new risks which must be addressed in subsequent reform of the reforms *Competitive Electricity Markets* describes the evolution of the market reform process including a number of challenging issues such as infrastructure investment resource adequacy capacity and demand participation market power distributed generation renewable energy and global climate change Sequel to *Electricity Market Reform An International Perspective* in the same series published in 2006 Contributions from renowned scholars and practitioners on significant electricity market design and implementation issues Covers timely topics on the evolution of electricity market liberalization worldwide *The Evolution of Electricity Markets in Europe* Leonardo Meeus,2020-11-10 Bridging theory and practice this book offers insights into how Europe has experienced the evolution of modern electricity markets from the end of the 1990s to the present day It explores defining moments in the process including the four waves of European legislative packages landmark court cases and the impact of climate strikes and marches Leonardo Meeus explains the sequence of electricity markets in Europe from wholesale to balancing markets forward transmission markets capacity mechanisms redispatching and flexibility markets Chapters explore current issues including the new paradigm that places the citizen at the centre of the energy transition Concluding that most of the market integration process in Europe so far has required horizontal coordination between transmission system operators in different countries the book looks ahead to the importance of vertical coordination between the transmission and distribution An invaluable book for energy policymakers and practitioners working in Europe the solutions offered for contemporary issues will also be helpful for those working in international or multi region electricity markets more widely Academics involved in the world of electricity regulation will also find this an invigorating read **Market Design Opportunities for an Evolving Power System** Ian Michael Schneider,2020 The rapid growth of renewable energy is transforming the electric power sector Wind and solar energy are non dispatchable their energy output is uncertain and variable from hour to hour New challenges arise in electricity markets with a large share of uncertain and variable renewable energy We investigate some of these challenges and identify economic opportunities and policy changes to mitigate them We study electricity markets by focusing on the preferences and strategic behavior of three different groups producers consumers and load serving entities First we develop a game theoretic model to investigate energy producer strategy in electricity markets with high levels of uncertain renewable energy We show

that increased geographic dispersion of renewable generators can reduce market power and increase social welfare We also demonstrate that high quality public forecasting of energy production can increase welfare Second we model and explain the effects of retail electricity competition on producer market power and forward contracting We show that increased retail competition could decrease forward contracting and increase electricity prices this is a downside to the general trend of increased access to retail electricity competition Finally we propose new methods for improving demand response programs A demand response program operator commonly sets customer baseline thresholds to determine compensation for individual customers The optimal way to do this remains an open question We create a new model that casts the demand response program as a sequential decision problem this formulation highlights the importance of learning about individual customers over time We develop associated algorithms using tools from online learning and we show that they outperform the current state of practice
