Food Mixing Principles And Applications:

Food Mixing P. J. Cullen, 2009-07-21 The mixing of liquids solids and gases is one of the most common unit operations in the food industry. Mixing increases the homogeneity of a system by reducing non uniformity or gradients in composition, properties or temperature. Secondary objectives of mixing include control of rates of heat and mass transfer, reactions and structural changes. In food processing applications, additional mixing challenges include sanitary design, complex rheology, desire for continuous processing and the effects of mixing on final product texture and sensory profiles. Mixing ensures delivery of a product with constant properties. For example, consumers expect all containers of soups, breakfast cereals, fruit mixes etc to contain the same amount of each ingredient. If mixing fails to achieve the required product yield, quality, organoleptic or functional attributes, production costs may increase significantly. This volume brings together essential information on the principles and applications of mixing within food processing. While there are a number of creditable references covering general mixing, such publications tend to be aimed at the chemical industry and so topics specific to food applications are often neglected. Chapters address the underlying principles of mixing, equipment design, novel monitoring techniques and the numerical techniques available to advance the scientific understanding of food mixing. Food mixing applications are described in detail. The book will be useful for engineers and scientists who need to specify and select mixing equipment for specific processing applications and will assist with the identification and solving of the wide range of mixing problems that occur in the food, pharmaceutical and bioprocessing industries. It will also be of interest to those who teach, study and research food science and food engineering.

Food Processing Handbook James G. Brennan, Alistair S. Grandison, 2012-05-07 The second edition of the Food Processing Handbook presents a comprehensive review of technologies, procedures and innovations in food processing, stressing topics vital to the food industry today and pinpointing the trends in future research and development. Focusing on the technology involved, this handbook describes the principles and the equipment used, as well as the changes in physical, chemical, microbiological and organoleptic that occur during food preservation. In so doing, the text covers in detail such techniques as post harvest handling, thermal processing, evaporation and dehydration, freezing, irradiation, high pressure processing, emerging technologies and packaging. Separation and conversion operations widely used in the food industry are also covered, as are the processes of baking, extrusion and frying. In addition, it addresses current concerns about the safety of processed foods, including HACCP systems, traceability and hygienic design of plant, and control of food processes, as well as the impact of processing on the environment, water and waste treatment, lean manufacturing and the roles of nanotechnology and fermentation in food processing. This two volume set is a must have for scientists and engineers involved in food manufacture, research and development in both industry and academia, as well as students of food related topics at undergraduate and postgraduate levels. From Reviews on the First Edition This work should become a standard text for students of food technology and is worthy of a place on the bookshelf of

anybody involved in the production of foods Journal of Dairy Technology August 2008 This work will serve well as an excellent course resource or reference as it has well written explanations for those new to the field and detailed equations for those needing greater depth CHOICE September 2006
