A Functional Electrical Stimulation (FES) Control System for Upper Limb Rehabilitation M. Sun,2014

Iterative Learning Control for Electrical Stimulation and Stroke Rehabilitation Chris T. Freeman, Eric Rogers, Jane H. Burridge, Ann-Marie Hughes, Katie L. Meadmore, 2015-06-25 Iterative learning control ILC has its origins in the control of processes that perform a task repetitively with a view to improving accuracy from trial to trial by using information from previous executions of the task This brief shows how a classic application of this technique trajectory following in robots can be extended to neurological rehabilitation after stroke Regaining upper limb movement is an important step in a return to independence after stroke but the prognosis for such recovery has remained poor Rehabilitation robotics provides the opportunity for repetitive task oriented movement practice reflecting the importance of such intense practice demonstrated by conventional therapeutic research and motor learning theory Until now this technique has not allowed feedback from one practice repetition to influence the next also implicated as an important factor in therapy The authors demonstrate how ILC can be used to adjust external functional electrical stimulation of patients muscles while they are repeatedly performing a task in response to the known effects of stimulation in previous repetitions As the motor nerves and muscles of the arm require the ability to convert an intention to move into a motion of accurate trajectory force and

rapidity initially intense external stimulation can now be scaled back progressively until the fullest possible independence of movement is achieved

**Control System Design for Electrical Stimulation in Upper Limb Rehabilitation** Chris Freeman, 2015-10-28 This book presents a comprehensive framework for model based electrical stimulation ES controller design covering the whole process needed to develop a system for helping people with physical impairments perform functional upper limb tasks such as eating grasping and manipulating objects The book first demonstrates procedures for modelling and identifying biomechanical models of the response of ES covering a wide variety of aspects including mechanical support structures kinematics electrode placement tasks and sensor locations It then goes on to demonstrate how complex functional activities of daily living can be captured in the form of optimisation problems and extends ES control design to address this case It then lays out a design methodology stability conditions and robust performance criteria that enable control schemes to be developed systematically and transparently ensuring that they can operate effectively in the presence of realistic modelling uncertainty physiological variation and measurement noise

**Functional Electrical Rehabilitation** Chandler A. Phillips, 2012-12-06 On one of my returns to California I attended the Disabilities Expo 88 at the Los Angeles Convention Center Among the various marvels of technology for the wheelchair disabled were stair climbing wheelchairs self raising and lowering kitchen cabinetry and even a completely accessible dude ranch experience At the same time as a guest of the Southern California Chapter of the National Spinal Cord Injury Association I was part of a small booth among the more than two hundred exhibitors in which we had spinal cord injured people up and walking with a lower extremity bracing system the reciprocating gait orthosis used at the PEERS Spinal Injury Program in Los Angeles I had a young man a C6 7 level quadriplegic walking with electrical muscle stimulation and lower extremity bracing The system is reviewed in Chapter 8 of this book As these disabled persons walked erect and upright among their wheel chair bound colleagues and took long confident strides past exhibits extolling the latest technological virtues of yet another new wheelchair Fig 1 I reflected on the paradox of it all What a majority of these paralyzed people were really looking for was an alteration of their disability so that they could more normally function in an unaltered environment What the great majority of the exhibitors were offering was an alteration of the environment so that they could more normally function with an unaltered disability

**Developing and Validating a Functional Electrical Stimulation Controller for Use with Visual Feedback Training for Standing Balance Therapy in Individuals with Incomplete Spinal Cord Injury** Emerson Paul Grabke, 2019 Incomplete spinal cord injury iSCI can impair standing balance increasing fall likelihood Visual feedback training VFT and functional electrical stimulation FES have shown promise in iSCI standing balance rehabilitation Combining VFT and lower limb FES was hypothesized to yield more effective standing balance therapy This thesis developed a VFT complementary FES system for regulating ankle muscles In my previous work I have developed a VFT system with another student For my thesis project I 1 designed an FES controller 2 optimized the controller to mimic able bodied ankle muscle activation data during VFT sessions and 3 tested the resultant FES controller on able bodied individuals as they underwent VFT to determine the effects of the FES controller on able bodied postural control As expected the resultant FES VFT system did not deteriorate able bodied postural control The results of this research contribute toward the development of a more effective standing balance rehabilitation system for individuals with iSCI
