Genome wide interaction studies is an extremely challenging problem in statistics in which conventional methods are often inadequate in terms of both power and computational efficiency. An exhaustive search for genome wide gene gene interactions becomes feasible with modern cluster computing run on graphics processing units. However the large number of tests accompanying the search raises a serious multiple testing problem. A way to overcome these limits is to apply a filtering step prior to the combinatorial method and to analyze only interesting single nucleotide polymorphisms selected based on a priori defined by statistical evidence: genetic impact or biological plausibility. The advantage of the filter approach is speed and the disadvantage is that attributes with poor quality scores are disregarded. Genome wide gene environment interaction is less problematic computationally compared with pairwise genome wide gene gene interaction. Accounting for gene gene and gene environment interactions is important for future strategies of diagnosis, prognosis and management of human diseases and will bring new data regarding pathogenetic mechanisms for human complex diseases.

Statistical Approaches to Gene X Environment Interactions for Complex Phenotypes Michael Windle, 2016-07-08

Findings from the Human Genome Project and from Genome Wide Association (GWA) studies indicate that many diseases and traits manifest a more complex genomic pattern than previously assumed. These findings and advances in high throughput sequencing suggest that there are many sources of influence: genetic, epigenetic and environmental. This volume investigates the role of the interactions of genes and environment. G x E in diseases and traits referred to by the contributors as complex phenotypes including depression, diabetes, obesity and substance use.

Computational Text Analysis Soumya Raychaudhuri, 2006-01-26

This book brings together the two disparate worlds of computational text analysis and biology and presents some of the latest methods and applications to proteomics, sequence analysis and gene expression data. Modern genomics generates large and comprehensive data sets but their interpretation requires an understanding of a vast number of genes, their complex functions and interactions. Keeping up with the literature on a single gene is a challenge itself for thousands of genes; it is simply impossible. Here Soumya Raychaudhuri presents the techniques and algorithms needed to access and utilize the vast scientific text, i.e. methods that automatically read the literature on all the genes. Including background chapters on the necessary biology, statistics and genomics in addition to practical examples of interpreting many different types of modern experiments, this book is ideal for students and researchers in computational biology, bioinformatics, genomics, statistics and computer science.
