Fundamentals of Food Process Engineering Romeo T. Toledo,2012-12-06 Ten years after the publication of the first edition of Fundamentals of Food Process Engineering there have been significant changes in both food science education and the food industry itself Students now in the food science curric ulum are generally better prepared mathematically than their counterparts two decades ago The food science curriculum in most schools in the United States has split into science and business options with students in the science option following the Institute of Food Technologists minimum requirements The minimum requirements include the food engineering course thus students en rolled in food engineering are generally better

than average and can be challenged with more rigor in the course material. The food industry itself has changed. Traditionally, the food industry has been primarily involved in the canning and freezing of agricultural commodities, and a company's operations generally remain within a single commodity. Now the industry is becoming more diversified with many companies involved in operations involving more than one type of commodity. A number of formulated food products are now made where the commodity connection becomes obscure. The ability to solve problems is a valued asset in a technologist, and often solving problems involves nothing more than applying principles learned in other areas to the problem at hand. A principle that may have been commonly used with one commodity may also be applied to another commodity to produce unique products.

Food Engineering, 1975 Physicochemical Aspects of Food Engineering and Processing Sakamon Devahastin, 2011. Physical and chemical interactions between various constituents resulting from processing operations often lead to physical sensory and nutritional changes in foods. Combining important information on processing and food quality, Physicochemical Aspects of Food Engineering and Processing describes the effects of various processing technologies on quality changes of different major foods in an integrative manner. Written by physicochemical experts in food engineering processing, Part I critically reviews the physicochemical property changes of different foods undergoing selected processes such as microencapsulation, frying, microwave-assisted thermal processing, high pressure processing, pulsed electric field processing, and freezing. This section also includes a chapter on the effects of various processing technologies on microbial growth and inactivation. Part II focuses on multiphase food systems made of proteins, seafoods, red meats, and pet foods and the physicochemical changes they undergo when being processed. Physicochemical Aspects of Food Engineering and Processing covers the engineering processing and quality angles equally. It is an extremely useful resource for academic and industrial researchers seeking an up-to-date overview of the increasingly important combination of both sides of food research and development.
