Dynamics And Robust Control Of Robot-environment Interaction Miomir Vukobratovic, Dragoljub Surdilovic, Yury Ekalov, Dusko Katic, 2009-03-06 This book covers the most attractive problem in robot control dealing with the direct interaction between a robot and a dynamic environment including the human robot physical interaction. It provides comprehensive theoretical and experimental coverage of interaction control problems starting from the mathematical modeling of robots interacting with complex dynamic environments and proceeding to various concepts for interaction control design and implementation algorithms at different control layers. Focusing on the learning principle, it also shows the application of new and advanced learning algorithms for robotic contact tasks. The ultimate aim is to strike a good balance between the necessary theoretical framework and practical aspects of interactive robots. **Advances on Theory and Practice of Robots and Manipulators** Marco Ceccarelli, Victor A. Glazunov, 2014-06-02 This proceedings volume contains papers that have been selected after review for oral presentation at ROMANSY 2014, the 20th CISM IFToMM Symposium on Theory and Practice of Robots and Manipulators. These papers cover advances on several aspects of the wide field of Robotics as concerning Theory and Practice of Robots and Manipulators. ROMANSY 2014 is the twentieth event in a series that started in 1973 as one of the first conference activities in the world on Robotics. Robust Control of Robots Adriano A. G. Siqueira,Marco H. Terra,Marcel Bergerman,2011-08-14 Robust Control of Robots bridges the gap between robust control theory and applications with a special focus on robotic manipulators It is divided into three parts robust control of regular fully actuated robotic

manipulators robust post failure control of robotic manipulators and robust control of cooperative robotic manipulators In each chapter the mathematical concepts are illustrated with experimental results obtained with a two manipulator system They are presented in enough detail to allow readers to implement the concepts in their own systems or in Control Environment for Robots a MATLAB based simulation program freely available from the authors The target audience for Robust Control of Robots includes researchers practicing engineers and graduate students interested in implementing robust and fault tolerant control methodologies to robotic manipulators

Robust Robotic Manipulation for Effective Multi-contact and Safe Physical Interactions Mikael Daniel Gabriel Jorda, 2020 Robots are complex systems at the intersection of numerous engineering domains The goal of many researchers is to build a fully capable and safe robot that can work and assist humans in their daily lives To reach these goals the complex robotic systems must be separated in different subsystem components such as perception world understanding navigation manipulation interfaces and interaction These subsystems need to be safe and robust in order to synergistically work together In particular a reliable and general robot manipulation framework for free space and contact tasks is required for robots to become useful in new environments In this thesis we aim at developing a theoretical and practical foundation for safe and robust robotic manipulation involving multiple simultaneous physical interactions with complex and unknown environments We start with the well known operational space control framework a task oriented control methodology that enables task dynamic decoupling and hierarchical control structures After reviewing the operational space control theory for controlling a robot task and posture we present a series of practical considerations for its robust implementation on real hardware platforms The integration in this framework of constraints such as joint limits and obstacles is then discussed and a method to react safely to unexpected contacts on the robot structure during operations is proposed These constraints are handled as control objectives in the control hierarchy using artificial potential fields to generate repulsive forces and dynamically consistent projections to ensure an independent control of the constraints and task objectives This systematic treatment of constraints at the control level enables a robust autonomous execution of complex tasks in changing environments This framework was extended over the years to consider underactuated robots in arbitrary contact situations This resulted in a comprehensive formulation to the problem of controlling a high dimensional robotic system involving complex tasks subject to various constraints obstacles balance and multiple contacts Contacts are essential for robot manipulation On the one hand parts of the robot tasks involve physical interactions that need to be controlled precisely On the other hand further contacts are required on underactuated systems in order to enable the robot motion and guarantee its balance In addition contacts between the robot and the environment are subject to geometric and friction constraints that need to be addressed by the control framework Therefore in this thesis the operational space whole body control framework is completed to enable a systematic treatment of multi contact scenarios A virtual linkage model separates the contact forces into three sets The resultant forces allow the robot to compensate for its underactuation The task contact

forces are controlled to their desired values. The internal forces provide a way to satisfy geometric and friction constraints. A method using barrier functions is proposed to specify a set of internal forces that ensure the robot's balance and contact stability. Even when the desired contact forces are correctly specified, their control remains a challenge. Indeed, the fast and discontinuous closed-loop dynamics of stiff physical interactions leads to instabilities in robot force control. Therefore, we adapt a time-domain passivity approach to guarantee the stability of explicit force controllers. This results in an increased robustness and safety for robotic systems in multiple contact scenarios. To develop effective interfaces for human-robot collaboration, we also study haptic robot teleoperation. Haptic devices provide an intuitive interface to remotely control robots and combine the high-level cognitive autonomy of humans with the autonomous manipulation capabilities of robots. The goal of haptic robot control is to maximize the transparency between the human operator and the robot environment. It means that the robot environment should be felt by the human as if they were directly interacting with it and the human commands should be executed precisely by the robot. Transparency is very challenging to achieve when communication delays are present in the system, which occurs systematically when there is a significant physical distance between the controlled robot and its human operator. To address this challenge, we propose a new paradigm for performing haptic robot control. Instead of relying on a global feedback loop, the new method establishes two autonomous controllers acting on the robot and the haptic device interfaced via a dual proxy model. The dual proxy is a bridge between the local controllers. It generates appropriate motion and force inputs that are consistent with the task physical interactions. The model relies on the exchange of position, contact, and environment geometry information, avoiding the limitations caused by a direct force feedback between robot and haptic device in conventional teleoperation. To estimate the environment contact geometry in real time, we also design a new perception algorithm that enables a fully autonomous implementation of the dual proxy model. The performance of all the control methods presented in this thesis are evaluated via simulations and hardware experimental validation. Combining these methods together results in a robust, safe, and generic manipulation control framework for complex robots in interaction with uncertain environments. Such framework is one of the key components for a complete and fully capable robotic system.

Biologically Inspired Control of Humanoid Robot Arms Adam Spiers, Said Ghani Khan, Guido Herrmann, 2018-05-30. This book investigates a biologically inspired method of robot arm control developed with the objective of synthesising human-like motion dynamically using nonlinear robust and adaptive control techniques in practical robot systems. The control method caters to a rising interest in humanoid robots and the need for appropriate control schemes to match these systems. Unlike the classic kinematic schemes used in industrial manipulators, the dynamic approaches proposed here promote human-like motion with better exploitation of the robot's physical structure. This also benefits human-robot interaction. The control schemes proposed in this book are inspired by a wealth of human motion literature that indicates the drivers of motion to be dynamic model-based and optimal. Such considerations lend themselves nicely to achievement via

nonlinear control techniques without the necessity for extensive and complex biological models The operational space method of robot control forms the basis of many of the techniques investigated in this book The method includes attractive features such as the decoupling of motion into task and posture components Various developments are made in each of these elements Simple cost functions inspired by biomechanical effort and discomfort generate realistic posture motion Sliding mode techniques overcome robustness shortcomings for practical implementation Arm compliance is achieved via a method of model free adaptive control that also deals with actuator saturation via anti windup compensation A neural network centered learning by observation scheme generates new task motions based on motion capture data recorded from human volunteers In other parts of the book motion capture is used to test theories of human movement All developed controllers are applied to the reaching motion of a humanoid robot arm and are demonstrated to be practically realisable This book is designed to be of interest to those wishing to achieve dynamics based human like robot arm motion in academic research advanced study or certain industrial environments The book provides motivations extensive reviews research results and detailed explanations It is not only suited to practising control engineers but also applicable for general roboticists who wish to develop control systems expertise in this area
