Marius Muench,2019 Embedded systems are a key component of modern life and their security is of utmost importance Hence the code running on those systems called firmware has to be carefully evaluated and tested to minimize the risks accompanying the ever growing deployment of embedded systems One common way to evaluate the security of firmware especially in the absence of source code is dynamic analysis Unfortunately compared to analysis and testing on desktop

system dynamic analysis for firmware is lacking behind In this thesis we identify the main challenges preventing dynamic analysis and testing techniques from reaching their full potential on firmware Furthermore we point out that rehosting is a promising approach to tackle these problems and develop avatar2 a multi target orchestration framework which is capable of running firmware in both fully and partially emulated settings Using this framework we adapt several dynamic analysis techniques to successfully operate on binary firmware In detail we use its scriptability to easily replicate a previous study we demonstrate that it allows to record and replay the execution of an embedded system and implement heuristics for better fault detection as run time monitors Additionally the framework serves as building block for an experimental evaluation of fuzz testing on embedded systems and is used as part in a scalable concolic execution engine for firmware Last but not least we present Groundhogger a novel approach for unpacking embedded devices firmware which unlike other unpacking tools uses dynamic analysis to create unpackers and evaluate it against three real world devices
