How Our Brain Became Human Yanko A. Yankov MD PhD.,2022-10-18 The human brain growth and evolution have been subjects of many genetic environmental or social studies separately Additionally there are very few available sources on the complex role of our microbiome and the recently discovered hormones VIP and PACAP The book author also describes some of his cases seen during his long clinical experience to illustrate different points of his extensive literature review The book is divided into seven chapters condensing the author s scientific opinion on the growth and evolution of the human brain the organ that differentiates us from all other species He does not dismiss any other opinions or beliefs The author challenges scientists and clinicians to continue researching the brain without prejudice At the end he gives his opinion on how our BIG brains can help us live better together

Endocrine and Paracrine Regulation of Spermatogenesis - A Collection of Up to Date Research Contributions on Testis Formation and Function Erwin Goldberg,Barry Zirk, Vassilios Papadopoulos,Polina V. Lishko,2022-08-29 *The Role of Thyroid Hormones in Vertebrate Development, volume II* Marco António Campinho,Laurent M. Sachs,2024-04-26 Thyroid hormones role in development was first suggested in the 18th century when a relationship between goiter and cretinism was found by F E Fodere But it was Rudolf Virchow work in the late 19th century with thyroidectomized animals that clearly demonstrated that goiter led to cretinism This opened the door to the understanding of TH action on vertebrate development However given the relative ease by which cretinism could be treated simply by eating animal thyroid gland or iodine supplementation research into the action of TH on vertebrate development has been lagging This was further enhanced by the complex biology of TH where after production in the gland entry activation and binding of the TH to cognate receptors in target cells is highly regulated Nonetheless new scientific advances and technologies are now providing tools to dissect the developmental role of TH on vertebrate development both embryonic and post natal The post natal role of TH in vertebrate development is long known from anuran studies but less evidences exist from other vertebrates Recently new evidences show that TH constitute key developmental signal in embryonic development of vertebrates especially in neural development from humans to fish This new evidences are corroborating long standing observations that infants from mothers with impaired TH physiology

presented changes in mental and cognitive indexes Nonetheless given that TH constitute integrative physiological signals in vertebrates a new scenario is emerging whereas TH seem to be important in the development and maturation of most organ systems in vertebrates during their different life transitions

Tissue Culture D. G. Newell, 1993 Cell and Tissue Culture provides a comprehensive collection of cell and tissue culture techniques and procedures to assist scientists with the labour intensive and expensive in vitro techniques Specific techniques are included together with standard techniques with an Editorial Advisory Board ensuring that all procedures are written by research workers eminent in their discipline Being a looseleaf format the contents are easily updated allowing for rapid dissemination of valuable revised and new techniques In this way information remains up to date and will also expand to ensure that every topic of interest is covered The manual should be considered an essential adjunct to any laboratory or library

Consciousness and Neural Plasticity Morten Overgaard, Mads Jensen, 2012-01-01 In contemporary consciousness studies the phenomenon of neural plasticity has received little attention despite the fact that neural plasticity is of still increased interest in neuroscience We will however argue that neural plasticity could be of great importance to consciousness studies If consciousness is related to neural processes it seems at least prima facie that the ability of the neural structures to change should be reflected in a theory of this relationship Neural plasticity refers to the fact that the brain can change due to its own activity The brain is not static but rather a dynamic entity which physical structure changes according to its use and environment This change may take the form of growth of new neurons the creation of new networks and structures and change within network structures that is changes in synaptic strengths Plasticity raises questions about the relation between consciousness and brain functions If consciousness is connected to specific brain structures as a function or in identity what happens to consciousness when those specific underlying structures change It is therefore possible that the understanding and theories of neural plasticity can have direct consequences for a theory about consciousness For instance theories of strict identity between consciousness and structure may face the serious dilemma to either accept that say the experience of the colour red is fundamentally different in one individual over time due to cortical changes or to abandon the strong identity thesis altogether Were one to pursue a theory according to which consciousness is not an epiphenomenon to brain processes consciousness may in fact affect its own neural basis The neural correlate of consciousness is often seen as a stable structure that is something that is stable over time Considering neural plasticity this is not necessarily so The NCC might change and hence literally change the way a person is conscious What it is about the NCC that can and might change is even though it can be relevant for the relation between the brain and consciousness is still an unanswered question There are hence a lot of questions that might shed light upon the relevant but unknown relations between consciousness and the brain Therefore We hereby propose to do a Research Topic on consciousness and neural plasticity to shed light on these underestimated issues In contemporary consciousness studies the phenomenon of neural plasticity has received little attention despite the fact that neural plasticity is of still increased interest in neuroscience We will however argue that neural plasticity could be of great importance to consciousness studies If consciousness is related to neural processes it seems at least prima facie that the ability of the neural structures to change should be reflected in a

theory of this relationship Neural plasticity refers to the fact that the brain can change due to its own activity The brain is not static but rather a dynamic entity which physical structure changes according to its use and environment This change may take the form of growth of new neurons the creation of new networks and structures and change within network structures that is changes in synaptic strengths Plasticity raises questions about the relation between consciousness and brain functions If consciousness is connected to specific brain structures as a function or in identity what happens to consciousness when those specific underlying structures change It is therefore possible that the understanding and theories of neural plasticity can have direct consequences for a theory about consciousness For instance theories of strict identity between consciousness and structure may face the serious dilemma to either accept that say the experience of the colour red is fundamentally different in one individual over time due to cortical changes or to abandon the strong identity thesis altogether Were one to pursue a theory according to which consciousness is not an epiphenomenon to brain processes consciousness may in fact affect its own neural basis The neural correlate of consciousness is often seen as a stable structure that is something that is stable over time Considering neural plasticity this is not necessarily so The NCC might change and hence literally change the way a person is conscious What it is about the NCC that can and might change is even though it can be relevant for the relation between the brain and consciousness is still an unanswered question There are hence a lot of questions that might shed light upon the relevant but unknown relations between consciousness and the brain Therefore We hereby propose to do a Research Topic on consciousness and neural plasticity to shed light on these underestimated issues *UCLA*

John G. Nicholls,A. Robert Martin,Bruce G. Wallace,1992 *From Neuron to Brain* Fourth Edition describes how nerve cells go about their business of transmitting signals how the signals are put together and how out of this integration higher functions emerge The emphasis as before is on experiments and on the way they are carried out Elements of format and presentation have been changed more headings have been introduced the paragraphs are shorter and the illustrations now in full color have been clarified Intended for use in upper level undergraduate graduate psychology and medical school neuroscience courses this book will be of interest to anyone who is curious about the workings of the nervous system *How We Remember and why We Forget* Rebecca Rupp,1998 HAVE YOU EVER WONDERED Why you can remember your first date but not what you had for lunch last Tuesday What slugs bugs and squirrels have to tell us about human memory How the smell of pine trees or buttered popcorn can help you remember Why dieting may make you forget Why practice makes perfect How a spell of the moody blues can affect your memory In this extraordinary book scientist Rebecca Rupp sheds light on one of the most mysterious and fascinating aspects of the brain our memory What are the chemical processes that occur

in the brain when we remember Why does memory change as we grow older How We Remember and Why We Forget also features useful memory improving techniques and tricks to remember essential information Learn to defeat that common bugbear of memory the forgetting of proper names pick up a quick trick for remembering telephone numbers and find out how to enrich your mind and impress your friends and colleagues by memorizing lengthy poems Tips like these lend a practical edge to this illuminating exploration of a largely uncharted realm

Ionic and Volume Changes in the Microenvironment of Nerve and Receptor Cells Eva Sykova, 1992-06-18 Stability of the internal environment in which neuronal elements are situated is unquestionably an important prerequisite for the effective transmission of information in the nervous system During the past decade our knowledge on the microenvironment of nerve cells has expanded The conception that the microenvironment of neurones comprises a fluid with a relatively simple and stable composition is no longer accepted the microenvironment is now envisaged as a dynamic structure whose composition shape and volume changes thereby significantly influencing neuronal function and the transmission of information in the nervous system The modern conception of the neuronal microenvironment is based on the results of research over the last 20 years The extracellular space ECS is comprehended not only as a relatively stable microenvironment containing neurones and glial cells Bernard 1878 but also as a channel for communication between them The close proximity of the neuronal elements in the CNS and the narrowness of the intercellular spaces provides a basis not only for interaction between the elements themselves but also between the elements and their microenvironment Substances which can cross the cell membranes can easily find their way through the microenvironment to adjacent cellular elements In this way the microenvironment can assure non synaptic communication between the relevant neurones Signalization can be coded by modulation of the chemical composition of the ECS in the vicinity of the cell membrane and does not require classic connection by axones dendrites and synapses
