Effects of Tillage Intensity on Soil C, N, and P Pools with Different Stability Christiane Piegholdt,2013 Effects of Tillage Intensity on Soil C, N, and P Pools Piegholdt Christiane,2015-12-02 Due to an interest of sustainable food production a key issue of environmental agriculture is the stabilization and increase of organic matter and nutrient contents in soils Accordingly the productivity of soils is a main focus to achieve similar crop yields compared to conventional agriculture This work investigated the influence of tillage intensity and various cover crops on fractions of C N and P with different stability in soil These fractions were determined in loess soils which are one of the most fertile soils in the world due to their physical and chemical properties The investigations were on 3 laboratory and field experiments to made conclusions about the possible influence of tillage intensity or growed and incorporated cover crops on C N and P fractions Overall it has been found that reduced tillage leads to a C and N sequestration in soils *Soil Management and Greenhouse Effect* John M. Sandra Corsi, 2012 Soil organic matter plays a crucial role in maintaining soil health and its productivity potential. However, most of the world's agricultural soils have become depleted in organic matter compared with their state under natural vegetation. This is because the dominant form of agriculture is based on tillage, which accelerates the decomposition of soil organic matter. Tillage-based production systems should therefore be transformed so that the future production intensification can be achieved sustainably. Conservation Agriculture: a system avoiding or Back cover
