## **Fouling Of Heat Exchanger Surfaces:**

**Fouling of Heat Exchangers** T.R. Bott,1995-04-13 This unique and comprehensive text considers all aspects of heat exchanger fouling from the basic science of how surfaces become fouled to very practical ways of mitigating the problem and from mathematical modelling of different fouling mechanisms to practical methods of heat exchanger cleaning The problems that restrict the efficient operation of equipment are described and the costs some of them hidden costs that are associated with the fouling of heat exchangers are discussed Some simple concepts and models of the fouling processes are presented as part of the introduction to the subject Advice on the selection design installation and commissioning of heat exchangers to minimise fouling is given A large part of the text is devoted to the use of chemical and other additives to reduce or eliminate the problem of fouling Another large section is designed to give information on both on line and off line cleaning of heat exchangers One of the difficulties faced by designers and operators of heat exchangers is anticipating the likely extent of fouling problems to be encountered with different flow streams Another large section addresses the question and describes methods that have been used in attempting to define fouling potential The book concludes with a chapter on how fouling information can be obtained using plant data field tests and laboratory studies *Composite Fouling on Heat Exchanger Surfaces* Yu Hong,2007

Deposition of amorphous silica SiO<sub>2</sub> and calcium oxalate CaOx on the calandria tubes of juice evaporators cause serious processing problems in Australian cane sugar mills The removal of these deposits by mechanical and chemical means is a time consuming and costly experience The cost of downtime and chemical cleaning can be several million dollars per year for the Australian sugar industry The interactions between CaOx and SiO<sub>2</sub> have not been investigated previously because conventional studies only address fouling by individual components The present work evaluates their interactions using two experimental approaches batch tests for assessing kinetic and thermodynamic behaviour and fouling loop experiments for examining composite fouling behaviour under different operating conditions These two approaches were employed both in the absence and in the presence of sugar to elucidate the effect of sugar on composite fouling mechanisms and to determine the controlling species responsible for composite fouling The combined information obtained from both the batch and fouling loop tests in this study offer a unique insight into the mechanisms of composite fouling of CaOx and SiO<sub>2</sub>
