## **Enhanced Oil Recovery Alkaline Surfactant Polymer Asp Injection:**

**Enhanced Oil Recovery Using the Alkaline-Surfactant-Polymer (ASP)** Darya Musharova, 2010 Alkaline Surfactant Polymer ASP process is a tertiary method of oil recovery that has promising results for future development. It has already been implemented in different areas of the United States such as Wyoming, West Texas, also in Canada and China. The success of this process depends on the proper combination of alkali, surfactant, and polymer and their compatibility with a reservoir. Therefore, the main objective of the proposed research is to identify chemical interactions between ASP chemicals and reservoir fluids and rock. I hypothesize that testing different alkalis, polymers, and surfactants will result not only in getting different profiles of rheological properties of ASP system but also analyzing compatibility degrees of chemicals with formation fluids and rock properties such as rock wettability, oil mobility, and sweep efficiency, which will be affected by the designed ASP system. In this paper, the results of chemical interactions between ASP chemicals and reservoir fluids are presented, and the phenomena occurred are described. The experiments conducted are considered to be unique for a selected oil sample with certain values of API gravity, viscosity, and chemical composition. Lab experiments conducted show the effect of polymer, alkali, and surfactant addition to an aqueous solution. Polymers were tested with alkali as a function of shear rate for the purposes of the buildup water viscosity in EOR. Different types of alkali at different concentrations are tested for alkali optimal concentration determination. The effect of adding surfactant at different concentrations has been tested, and acidic number of tested oil sample was identified. Polymers tested with alkali result in non-Newtonian behavior of the testing solution and display a shear thinning beneficial effect for the buildup water viscosity in EOR. The results show that acidic number of crude oil is a critical parameter that affects the optimal concentration for mixing chemicals and interfacial tension profile. The alkali and surfactant added to crude oil result in a significant reduction of interfacial tension and lead to increase of oil mobilization, which is a desired output after ASP injection in EOR process.

### **Alkali-surfactant-polymer (ASP)**

**Flooding - Potential and Simulation for Alaskan North Slope Reservoir** Tejas S. Ghorpade, 2014 Enhanced oil recovery EOR is essential to recover bypassed oil and improve recovery factor. Alkaline surfactant polymer ASP flooding is a chemical EOR method that can be used to recover heavy oil containing organic acids from sandstone formations. It involves injection of alkali to generate in situ surfactants, improve sweep efficiency, and reduce interfacial tension (IFT) between displacing and displaced phase, and injection of a polymer to improve mobility ratio. Typically, it is followed by extended waterflooding. The concentration of alkali, surfactant, and polymer used in the process depends on oil type, salinity of solution, pressure, temperature of the reservoir, and injection water quality. This project evaluates the effect of waterflooding on recovery, calculates the recovery factor for ASP flooding, and optimum concentration of alkali, surfactant, and polymer for an Alaskan reservoir. Also, the effects of waterflooding and improvement with ASP flooding are evaluated and compared. Studies of these effects on oil recovery were analyzed with a Computer Modeling Group (CMG) generated model for the Alaskan North Slope.

ANS reservoir Based on a literature review and screening criteria the Western North Slope WNS 1 reservoir was selected for the ASP process A CMG WinProp simulator was used to create a fluid model and regression was carried out with the help of actual field data The CMG WinProp model was prepared with a 5 spot well injection pattern using the CMG STARS simulator Simulation runs conducted for primary and waterflooding processes showed that the recovery factor increased from 3% due to primary recovery to 45% due to waterflooding at 500 psi drawdown for 60 years with a constant producing gas oil ratio GOR ASP flooding was conducted to increase recovery further and optimum ASP parameters were calculated for maximum recovery Also effect of alkali surfactant and polymer on recovery was observed and compared with ASP flood If proved effective the use of ASP chemicals for ANS reservoirs to increase the recovery factor could replace current miscible gas injection with chemical EOR It will help to develop chemical flooding processes for heavier crude oil produced in harsh environments and create new horizons for chemical industries in Alaska
