Information Systems (GIS) and Multicriteria Decision Analysis (MCDA) in the Natural Resources Management

Mladen Jurišić, 2019 Decision making in any sector of economy involves multiple objectives manifold criteria and complex network of social interests and preferences that demands a systematic approach in order to rationalize and justify the future actions to be taken Allocation of resources and resource planning have become one of the key issues The aim of this paper is to contribute to discussion on Geographic Information System and Multi criteria Decision Analysis and possibilities they could offer in the natural resources management using the production of hazel as an example It is possible to improve the economic aspect of the business by applying Multi criteria Decision Analysis and geographic information systems as a support to decision making especially if the user has limited resources or if there are plenty of options at hand as for instance in agricultural production Through Multi criteria Decision Analysis and previous research on the subject of analysis the

possibility of modelling the impact on the individual segment of agricultural production is created not only separately but as a whole as well. That way resource management gives the user a realistic possibility for a faster and better production as well as greater income than it would be possible in the situation of having immense resources available but which would not be used economically. The paper concludes with recommendations on further actions needed to exploit the full potential of GIS and MCDA.

GIS-Based Multicriteria Decision Analysis for Land Evaluation Alireza Taravat, 2013. GIS has been very important in business mapping and charting geospatial intelligence, health services, tourism, and natural resources management including land use planning, natural hazard assessment, and etc. Urban planning is one of the main applications in which the advantages of GIS seem to be broadly accepted in general. GIS can provide the necessary planning platform for visualization, modeling, analysis, and collaboration. Other information systems for urban planning include database management systems, DBMS, and decision support systems, DSS. A database-oriented GIS spatial and textual data can be stored and linked using the geo-relational model. Planners can also extract data from their databases and input them to other modeling and spatial analysis programs. When the planner's database is combined with data from other tabular databases or specially conducted surveys, geographical information can be used to make effective planning decisions. This book describes a methodology to calculate the land evaluation base on distance for reaching activity places. A series of subjective measures of accessibility based on distances made by road network is built for Malayer City.

Trends in Multiple Criteria Decision Analysis Salvatore Greco, Matthias Ehrgott, José Rui Figueira, 2010-09-10. Multiple Criteria Decision Making (MCDM) is the study of methods and procedures by which concerns about multiple conflicting criteria can be formally incorporated into the management planning process. A key area of research in OR/MS, MCDM is now being applied in many new areas including GIS systems, AI, and group decision making. This volume is in effect the third in a series of Springer books by these editors, all in the ISOR series, and it brings all the latest developments in MCDM into focus. Looking at developments in the applications, methodologies, and foundations of MCDM, it presents research from leaders in the field on such topics as Problem Structuring Methodologies, Measurement Theory, and MCDA. Recent Developments in Evolutionary Multiobjective Optimization, Habitual Domains, and Dynamic MCDM in Changeable Spaces, Stochastic Multicriteria Acceptability Analysis, and many more chapters.

Use of Multi-criteria Decision Analysis with Fuzzy Measures in Historical GIS Jeanne M. Jones, 2010. Geographic information systems (GIS) can enhance historical research by providing tools to explore the spatial relationships of locations in historical sources. However, no widespread methods currently exist for translating vaguely defined historical spatial information into GIS data formats and producing a location estimate. Other GIS techniques do exist that can model the necessary process. Multi-criteria decision analysis with fuzzy measures can be applied to vague historical records to approximate location. The Wieslander Vegetation

Type Map dataset is used to demonstrate the model effectiveness Results show that this technique successfully translated written descriptions of location into raster or grid based surfaces within a GIS Given the uncertainty of the qualitative descriptions the technique resolved the text into a collection of locations instead of a single location with a probability assigned to each location conveying the ambiguity associated with the results and the probabilistic nature of its interpretation
