

GLOBAL POSITIONING SYSTEM

A Field Guide for the Social Sciences

GLOBAL POSITIONING SYSTEM
SCIENCE, PRINCIPLE, PRACTICE, AND VOGLER

"An invaluable resource for social, economic or health researchers and practitioners who want to add a geographic component to their work."

—Tom Christensen, Development Research Group, World Bank

Global Positioning System is the first book to guide social scientists with little or no mapping or GPS experience through the process of collecting field data from start to finish.

The book takes readers step-by-step through all the key stages of a GPS fieldwork project, covering planning, implementation, and data integration. For each phase, the authors supply clear and concise explanations of relevant technical topics, such as accuracy issues, the selection of appropriate GPS equipment, and the use of coordinate systems. Separate text boxes highlight important practical considerations and give sample solutions for real GPS data collection issues. Model checklists for project planning and equipment can be used as a basis for readers' own projects.

Researchers and students from fields as diverse as sociology, anthropology, geography, and public health will find this an invaluable resource.

Using the Global Positioning System in Household Surveys for Better Economics and Better Policy John Gibson, David J. McKenzie, 2007 Distance and location are important determinants of many choices that economists study While these variables can sometimes be obtained from secondary data economists often rely on information that is self reported by respondents in surveys These self reports are used especially for the distance from households or community centers to various features such as roads markets schools clinics and other public services There is growing evidence that self reported distance is measured with error and that these errors are correlated with outcomes of interest In contrast to self reports the Global Positioning System GPS can determine almost exact location typically within 15 meters The falling cost of GPS receivers typically below US 100 makes it increasingly feasible for field surveys to use GPS as a better method of measuring location and distance In this paper the authors review four ways that GPS can lead to better economics and better policy 1 through constructing instrumental variables that can be used to understand the causal impact of policies 2 by helping to understand policy externalities and spillovers 3 through better understanding of access to services and 4 by improving the collection of household survey data They also discuss several pitfalls and unresolved problems with using GPS in household surveys
