

Extraction of DNA from Onion

Overview

To most students of biology, DNA is an abstraction. You can memorize the names and structures of the nitrogenous bases and know all about the history of DNA's discovery, but until you actually handle DNA, it remains a strange and mysterious substance.

The purpose of this laboratory is to give you firsthand experience with DNA by isolating it from plant tissue. You will start with whole onions and end with a relatively pure preparation of DNA, containing literally millions of genes. Once isolated, the DNA can be stored in alcohol or dried out. It will actually be possible for you to hold in your hands the key to an organism's development and structure.

Objectives

1. To become familiar with the physical properties of DNA by isolating it from living tissue
2. To learn the purpose of each step in the isolation procedure as it relates to the physical and biochemical characteristics of the genetic material

Materials and Equipment

The following materials can be shared by a group of students:

- 52 °C water bath

Contained in this text are 18 laboratory projects that explore the structural biochemical and physiological nature of eukaryotic cells. Topics are largely traditional; however, several investigations employ new methodologies. Extended coverage of biochemistry is offered, and materials have been selected for availability and ease of handling, e.g., extraction of DNA and RNA done with calf liver succinate dehydrogenase activity studied in mitochondria isolate from cauliflower.
