

Factoring out the GCF of a Polynomial

1. Write the polynomial under the upside down division sign.
2. Find a number that divides evenly into each coefficient and constant.
3. Divide by this common factor and keep dividing by other factors until the only that number that divides into each term is 1.
4. Divide by any variables that each term has in common.
5. The GCF is found on the outside of the division sign.
6. Place parentheses around the terms at the bottom of the division sign.
7. Write your answer with the GCF outside of the parentheses.

Stephen Sheldon Colvin

Factoring Polynomial Foldable:

Geometric Folding Algorithms Erik D. Demaine, Joseph O'Rourke, 2007-07-16 Did you know that any straight line drawing on paper can be folded so that the complete drawing can be cut out with one straight scissors cut That there is a planar linkage that can trace out any algebraic curve or even sign your name Or that a Latin cross unfolding of a cube can be refolded to 23 different convex polyhedra Over the past decade there has been a surge of interest in such problems with applications ranging from robotics to protein folding With an emphasis on algorithmic or computational aspects this treatment gives hundreds of results and over 60 unsolved open problems to inspire further research The authors cover one dimensional 1D objects linkages 2D objects paper and 3D objects polyhedra Aimed at advanced undergraduate and graduate students in mathematics or computer science this lavishly illustrated book will fascinate a broad audience from school students to researchers

Protein Folding Protocols Yawen Bai, 2008-02-04 Protein Folding Protocols presents protocols for studying and characterizing steps and conformational ensembles populating pathways in protein folding from the unfolded to the folded state It further presents a sample of approaches toward the prediction of protein structure starting from the amino acid sequence in the absence of overall homologous sequences Protein folding is a crucial step in the transfer of genetic information from the DNA to the protein The Genome Project has led to a huge number of available DNA sequences and therefore protein sequences The Structural Genomics initiative largely aims to obtain new folds not currently present in the Protein Data Bank Yet the number of available structures inevitably lags behind the number of sequences At the same time an equally important problem is to find out the types and scope of dissimilar nonhomologous protein sequences that adopt a similar fold Assembling data and comprehension of the sequence space of protein folds should be very useful in computational protein structure prediction This would enhance the scope of homology modeling which currently is the method of choice Thus experimental and theoretical studies on the relationship between sequence and structure are critical Figuring out the relationship between sequence and structure would further assist in the prediction of fibril structures observed in protein misfolding diseases and in figuring out the conformational changes and dynamics resulting from mutations Protein folding is one of the most important and challenging problems in current molecular and chemical biology

Biophysical, Chemical, and Functional Probes of RNA Structure, Interactions and Folding: Part B Daniel Herschlag, 2009-11-16 This MIE volume provides laboratory techniques that aim to predict the structure of a protein which can have tremendous implications ranging from drug design to cellular pathways and their dynamics to viral entry into cells Expert researchers introduce the most advanced technologies and techniques in protein structure and folding Includes techniques on tiling assays
