Embedded Computer Vision Advances In Computer Vision And Pattern Recognition:

Advances in Embedded Computer Vision Branislav Kisačanin, Margrit Gelautz, 2014-11-26 This illuminating collection offers a fresh look at the very latest advances in the field of embedded computer vision. Emerging areas covered by this comprehensive text reference include the embedded realization of 3D vision technologies for a variety of applications such as stereo cameras on mobile devices. Recent trends towards the development of small unmanned aerial vehicles (UAVs) with embedded image and video processing algorithms are also examined. Topics and features discussed in detail include three major success stories: the development of the optical mouse, vision for consumer robotics, and vision for automotive safety. Reviews state of the art research on embedded 3D vision, UAVs, automotive vision, mobile vision apps, and augmented reality. Examines the potential of embedded computer vision in such cutting edge areas as the Internet of Things, the mining of large data streams, and in computational sensing. Describes historical successes, current implementations, and future challenges.

Embedded Computer Vision, 2008 **Embedded Computer Vision** Branislav Kisačanin, Shuvra S. Bhattacharyya, Sek Chai, 2008-09-26 As a graduate student at Ohio State in the mid 1970s I inherited a unique computer vision laboratory from the doctoral research of previous students. They had designed and built an early frame grabber to deliver digitized color video from a very large electronic video camera on a tripod to a mini computer system with a huge disk drive about the size of four washing machines. They had also designed a binary image array processor and programming language complete with a user's guide to facilitate designing software for this one-of-a-kind processor. The overall system enabled programmable real-time image processing at video rate for many operations. I had the whole lab to myself. I designed software that detected an object in the field of view, tracked its movements in real time, and displayed a running description of the events in English. For example: "An object has appeared in the upper right corner. It is moving down and to the left. Now the object is getting closer. The object moved out of sight to the left about like that." The algorithms were simple, relying on a sufficient image intensity difference to separate the object from the background, a plain wall. From computer vision papers I had read I knew that vision in general imaging conditions is much more sophisticated. But it worked; it was great fun, and I was hooked. **Graph-Based Methods in**

Computer Vision: Developments and Applications Bai, Xiao, Cheng, Jian, Hancock, Edwin, 2012-07-31 Computer vision, the science and technology of machines that see, has been a rapidly developing research area since the mid 1970s. It focuses on the understanding of digital input images in many forms, including video and 3D range data. *Graph-Based Methods in Computer Vision: Developments and Applications* presents a sampling of the research issues related to applying graph-based methods in computer vision. These methods have been underutilized in the past but use must now be increased because of their ability to naturally and effectively represent image models and data. This publication explores current activity and future applications of this fascinating and ground-breaking topic. **Mobile Computing, Applications, and Services** David
