**Coral Reef Remote Sensing** James A. Goodman, Samuel J. Purkis, Stuart R. Phinn, 2013-04-18 Remote sensing stands as the defining technology in our ability to monitor coral reefs as well as their biophysical properties and associated processes at regional to global scales. With overwhelming evidence that much of Earth's reefs are in decline, our need for large scale repeatable assessments of reefs has never been so great. Fortunately, the last two decades have seen a rapid expansion in the ability for remote sensing to map and monitor the coral reef ecosystem, its overlying water column and surrounding environment. Remote sensing is now a fundamental tool for the mapping, monitoring and management of coral reef ecosystems. Remote sensing offers repeatable quantitative assessments of habitat and environmental characteristics over spatially extensive areas. As the multi-disciplinary field of coral reef remote sensing continues to mature, results demonstrate that the techniques and capabilities continue to improve. New developments allow reef assessments and mapping to be performed with higher accuracy across greater spatial areas and with greater temporal frequency. The increased level of information that remote sensing now makes available also allows more complex scientific questions to be addressed. As defined for this book, remote sensing includes the vast array of geospatial data collected from land, water, ship, airborne and satellite platforms. The book is organized by technology, including visible and infrared sensing using photographic, multispectral and hyperspectral instruments; active sensing using light detection and ranging (LiDAR); acoustic sensing using ship autonomous underwater vehicle (AUV) and in-water platforms; and thermal and radar instruments. **Emphasis and Audience** This book serves multiple roles. It offers an overview of the current state-of-the-art technologies for reef mapping, provides detailed technical information for coral reef remote sensing specialists, imparts insight on the scientific questions that can be tackled using this technology, and also includes a foundation for those new to reef remote sensing. The individual sections of the book include introductory overviews of four main types of remotely sensed data used to study coral reefs, followed by specific examples demonstrating practical applications of the different technologies being discussed. Guidelines for selecting the most appropriate sensor for particular applications are provided, including an overview of how to utilize remote sensing data as an effective tool in science and management. The text is richly illustrated with examples of each sensing technology applied to a range of scientific monitoring and management questions in reefs around the world. As such, the book is broadly accessible to a general audience as well as students, managers, remote sensing specialists, and anyone else working with coral reef ecosystems.

**Landscape Dynamics, Soils and Hydrological Processes in Varied Climates** Assefa M. Melesse, Wossenu Abtew, 2015-07-21 The book presents the processes governing the dynamics of landscapes, soils and sediments, water and energy under different climatic regions using studies conducted in varied climatic zones including arid, semi-arid, humid and wet regions. The spatiotemporal availability of the processes and fluxes and their linkage to the environment, land, soil and water management are presented at various scales. Spatial scales including laboratory, field

watershed river basin and regions are represented The effect of tillage operations and land management on soil physical characteristics and soil moisture is discussed The book has 35 chapters in seven sections 1 Landscape and Land Cover Dynamics 2 Rainfall Runoff Processes 3 Floods and Hydrological Processes 4 Groundwater Flow and Aquifer Management 5 Sediment Dynamics and Soil Management 6 Climate change impact on vegetation sediment and water dynamics and 7 Water and Watershed Management
