Dynamic Programming And Stochastic Control Volume 125 Mathematics In Science And Engineering:

Ship Motion Control Tristan Perez, 2006-03-30 engineers into a single volume whilst concentrating on two important research control design problems autopilots with rudder roll stabilization and fin and combined rudder fin stabilization He has been guided by some of the leading marine control academics in particular Mogens Blanke and Thor Fossen indeed Chapters 3 and 4 on kinematics and kinetics of ship motion are jointly authored with Professor Fossen There are some 240 cited references an invaluable resource for interested readers The volume is likely to appeal to a wide range of readers who will each be able to extract something different from the various parts of the monograph Part I has some four chapters on the modelling fundamentals including kinematics dynamics and actuators Part II is a very useful survey of the ship roll stabilization problem and how ship roll performance is measured and assessed This clearly motivates the human necessity for roll reduction and roll stabilization Parts III and IV move on to the control systems aspects of the various stabilization designs Valuable material here includes a study of system performance limitations as caused by the presence of non minimum phase characteristics and actuator saturation Chapter 10 has an interesting historical review of these marine control problems stretching back some thirty years into the 1970s

Multiple Use of Forests and Other Natural Resources F. Helles, Per Holten-Andersen, Lars Wichmann, 2001-11-30 This volume comprises eighteen papers dealing with the theory and application of modern decision making and management planning of multiple use of forestry and other natural resources in the landscape Generally an economic approach is used as implemented by operations research methods but broader contexts are applied too e g ecosystem management discounting preference analysis and policy formulation The volume is aimed at researchers students and practitioners in management of forestry and other natural resources

Continuous Cover Forestry Klaus von Gadow, Jürgen Nagel, Joachim Saborowski, 2013-03-09 The large scale application of new silvicultural systems has become a political reality in many parts of the world This involves a gradual transformation of traditional silvicultural practice towards Continuous Cover Forestry also known as near natural forest management favouring mixed uneven aged stands site adapted tree species and selective harvesting Selective harvesting systems have a long tradition Specific CCF related resource assessment forecasting and sustainable harvest control techniques have been developed but details about their use are not widely known The objective of this volume is to present state of the art research results and techniques relating to CCF management with an emphasis on systems engineering and modelling Using a very simple classification based on the development of timber volume over age or time we may distinguish two types of sustainable forest management systems Rotation forest management RFM systems characterized by standard silvicultural treatments and repetitive cycles of clearfelling followed by planting and continuous cover forestry CCF systems which are characterized by selective harvesting and natural regeneration resulting in uneven aged structures and frequently also in multi species forests The distinction is usually the result of decisions relating to the cost of timber harvesting simplicity of management or various intangible

benefits The oldest and most perfect examples of CCF systems are the so called plenter selection forests found in France Switzerland Slovenia and Germany Today CCF systems are encountered in various regions of Europe North America and in some tropical and sub tropical forests of South Africa Asia and South America
