Generalized Network Design Problems Generalized Network Design Problems:

Generalized Network Design Problems Petrica C. Pop, 2012-10-30 Combinatorial optimization is a fascinating topic. Combinatorial optimization problems arise in a wide variety of important fields such as transportation, telecommunications, computer networking, location planning, distribution problems, etc. Important and significant results have been obtained on the theory, algorithms, and applications over the last few decades. In combinatorial optimization, many network design problems can be generalized in a natural way by considering a related problem on a clustered graph where the original problem's feasibility constraints are expressed in terms of the clusters, i.e., node sets instead of individual nodes. This class of problems is usually referred to as generalized network design problems (GNDPs) or generalized combinatorial optimization problems. The express purpose of this monograph is to describe a series of mathematical models, methods, propositions, algorithms developed in the last years on generalized network design problems in a unified manner. The book consists of seven chapters where, in addition to an introductory chapter, the following generalized network design problems are formulated and examined: the generalized minimum spanning tree problem, the generalized traveling salesman problem, the railway traveling salesman problem, the generalized vehicle routing problem, the generalized fixed charge network design problem, and the generalized minimum vertex biconnected network problem. The book will be useful for researchers, practitioners, and graduate students in operations research, optimization, applied mathematics, and computer science. Due to the substantial practical importance of some presented problems, researchers in other areas will find this book useful too.

Generalized Network Design Problems Corinne Feremans, 2002 Network design problems consist of identifying an optimal subgraph of a graph subject to side constraints. In generalized network design problems, the vertex set is partitioned into clusters and the feasibility conditions are expressed in terms of the clusters. Several applications of generalized network design problems arise in the fields of telecommunications, transportation, and biology. The aim of this review paper is to formally define generalized network design problems, to study their properties, and to provide some applications. The generalized problems studied are the minimum spanning tree problem, the travelling salesman problem, the minimum perfect matching problem, the minimum two edge connected spanning network, the minimum clique problem, the Steiner tree problem, and the shortest path problem.

Hybrid Metaheuristics for Generalized Network Design Problems Bin Hu, 2012 In this book, we consider several generalized network design problems which belong to the family of NP-hard combinatorial optimization problems. In contrast to their classical counterparts, the generalized versions are defined on graphs whose node sets are partitioned into clusters. The goal is to find a subgraph which spans exactly one node from each cluster and also meets further constraints, respectively. Applicable methodologies for solving combinatorial optimization problems can roughly be divided into two mainstreams. The first class consists of algorithms which aim to solve these

problems to proven optimality provided that they are given enough run time and memory The second class are metaheuristics which compute approximate solutions but usually require significantly less run time By combining these two classes we are able to form collaboration algorithms that benefit from advantages of both sides Such approaches are considered for solving the generalized network design problems in this book **Encyclopedia of Optimization**
