5. EDDY CURRENTS

- When bulk pieces of conductors are subjected to changing magnetic flux, induced currents are produced in them.
- The flow patterns of induced currents resemble the swirling eddies in water. This effect was discovered by Foucault and these currents are called *eddy currents (or) Foucault currents*.
- The eddy currents are minimized by using laminations of metal to make a metal core. The laminations are separated by an insulating material like lacquer.
- The plane of the laminations must be arranged parallel to the magnetic field, so that they cut across the eddy current paths reduces the strength of the eddy current.

v) Advantages :

Eddy currents are used in

- Magnetic braking in trains;
- Electromagnetic damping;
- Induction furnace;
- Electric power meters;

6. MUTUAL INDUCTION :

- When current in one coil changes, magnetic flux linked with the second coil placed near by it also changes. Then emf induced in secondary is called mutually induced emf and the phenomenon is called mutual induction.

- If i_p is current flowing in the primary coil, ' ϕ_s ' is magnetic flux linked with secondary coil, then

$$\phi_s \propto i_p \Rightarrow \phi_s = M i_p, \quad \therefore M = \frac{\phi_s}{i_p}$$

Here 'M' is called coefficient of mutual induction or mutual inductance.

- Induced emf in secondary coil is

$$e = -\frac{d\phi}{dt} = -M \left(\frac{di_p}{dt} \right) \text{ (or) } M = \frac{e}{-di_p/dt}$$

- Mutual inductance between two coils is equal to the magnetic flux linked in the secondary coil when unit current passes through the primary coil (or) emf induced in one coil when current in the other coil changes at the rate of 1 Amp/second.
- Dimensional formula of self inductance or mutual inductance is $ML^2T^{-2}A^{-2}$
- Mutual Inductance depends mainly on**
 - Geometry of the two circuits.
 - Mutual inductance increases with increase in number of turns in the coil.
 - Mutual inductance decreases with increase in distance between the coils.
 - Mutual inductance increases with increase in cross sectional area of coils.
 - Mutual inductance increases with permeability of material of the core.
 - Mutual inductance between two coils is maximum, if the angle between their axes is 0° , and is minimum if the angle between their axis is 90°
- Consider two solenoids 1 and 2 with number of turns per unit length n_1 and n_2 , with coil 1 inside coil 2 co-axially placed. Then mutual inductance between the coils is given by $M = \mu_0 n_1 n_2 \pi r_1^2 \ell$
Where r_1 is radius of cross sections of inner coil and ℓ is the length of inner coil.
- If a magnetic material of relative permeability μ_r fills the space of inside solenoid, then
 $M = \mu_r \mu_0 n_1 n_2 \pi r_1^2 \ell$
- The above expressions are true only if current is varied slowly so that expression for a magnetic field inside solenoid due to steady current ($B = \mu_0 ni$) is applicable.
- Mutual Inductance for the coil 1 due to 2 is equal to mutual inductance for the coil 2 due to 1
i.e : $M_{12} = M_{21}$
