

Notre travail s'intéresse à l'analyse de scène. Il étudie la similarité pouvant exister entre objets d'une image. Afin d'accomplir une telle tâche, nous commençons par extraire les différents objets, nous étudions la similarité par leur classification, en utilisant l'algorithme de K-means. Dans ce travail nous détectons la similarité entre objets par l'application d'une différence de pixels simple entre objets extraits.

Dans le domaine de la photographie, l'observation microscopique reste incontournable. On pourrait s'attendre ce que les composants photographiques puissent être aisément quantifiés et caractérisés de façon informatique. Toutefois, en raison de la complexité et de la grande variété des images, les logiciels du marché ne se montrent pas toujours très performants. Cette thèse tente de pallier cette lacune en fournissant une palette d'outils informatiques plus adaptés à la visualisation et l'analyse d'

images photographiques Ces outils ont été développés en langage Java et regroupés dans le logiciel JMicroVision Cette thèse propose un nouvel algorithme de séparation des grains connexes D'autres outils innovants notamment l'analyse granulométrique ou le comptage de points informatisés ont été développés Plusieurs marches suivre pour des analyses photographiques sont proposées dans la deuxième partie de cette thèse
