Hardin, James William Hardin, Joseph M. Hilbe, Joseph Hilbe, 2007 Deftly balancing theory and application this book stands out in its coverage of the derivation of the GLM families and their foremost links This edition has new sections on discrete response models including zero truncated zero inflated censored and hurdle count models as well as heterogeneous negative binomial and more **Foundations of Linear and Generalized Linear Models** Alan Agresti, 2015-01-15 A valuable overview of the most important ideas and results in statistical modeling Written by a highly experienced author *Foundations of Linear and Generalized Linear Models* is a clear and comprehensive guide to the key

concepts and results of linear statistical models. The book presents a broad in depth overview of the most commonly used statistical models by discussing the theory underlying the models, R software applications and examples with crafted models to elucidate key ideas and promote practical model building. The book begins by illustrating the fundamentals of linear models such as how the model fitting projects the data onto a model vector subspace and how orthogonal decompositions of the data yield information about the effects of explanatory variables. Subsequently the book covers the most popular generalized linear models which include binomial and multinomial logistic regression for categorical data and Poisson and negative binomial loglinear models for count data. Focusing on the theoretical underpinnings of these models, *Foundations of Linear and Generalized Linear Models* also features an introduction to quasi likelihood methods that require weaker distributional assumptions such as generalized estimating equation methods. An overview of linear mixed models and generalized linear mixed models with random effects for clustered correlated data, Bayesian modeling and extensions to handle problematic cases such as high dimensional problems. Numerous examples that use R software for all text data analyses. More than 400 exercises for readers to practice and extend the theory, methods and data analysis. A supplementary website with datasets for the examples and exercises. An invaluable textbook for upper undergraduate and graduate level students in statistics and biostatistics courses. *Foundations of Linear and Generalized Linear Models* is also an excellent reference for practicing statisticians and biostatisticians as well as anyone who is interested in learning about the most important statistical models for analyzing data.

Applied Regression Analysis and Generalized Linear Models John Fox, 2015-03-18. Combining a modern data analytic perspective with a focus on applications in the social sciences, the Third Edition of *Applied Regression Analysis and Generalized Linear Models* provides in depth coverage of regression analysis, generalized linear models and closely related methods such as bootstrapping and missing data. Updated throughout, this Third Edition includes new chapters on mixed effects models for hierarchical and longitudinal data. Although the text is largely accessible to readers with a modest background in statistics and mathematics, author John Fox also presents more advanced material in optional sections and chapters throughout the book. Accompanying website resources containing all answers to the end of chapter exercises, Answers to odd numbered questions as well as datasets and other student resources are available on the author's website. *NEW* Bonus chapter on Bayesian Estimation of Regression Models also available at the author's website.

Mixed Effects Models and Extensions in Ecology with R Alain Zuur, Elena N. Ieno, Neil Walker, Anatoly A. Saveliev, Graham M. Smith, 2009-03-05. Building on the successful *Analysing Ecological Data* 2007 by Zuur, Ieno and Smith, the authors now provide an expanded introduction to using regression and its extensions in analysing ecological data. As with the earlier book, real data sets from postgraduate ecological studies or research projects are used throughout. The first part of the book is a largely non mathematical introduction to linear mixed effects modelling, GLM and GAM, zero inflated models, GEE, GLMM and GAMM. The second part provides ten case studies that range from koalas to deep sea research. These chapters

provide an invaluable insight into analysing complex ecological datasets including comparisons of different approaches to the same problem By matching ecological questions and data structure to a case study these chapters provide an excellent starting point to analysing your own data Data and R code from all chapters are available from www.highstat.com

Negative Binomial Regression Joseph M. Hilbe, 2011-03-17 A substantial enhancement of the only text devoted entirely to the negative binomial model and its many variations *Modeling Count Data* Joseph M. Hilbe, 2014-07-21 This entry level text offers clear and concise guidelines on how to select construct interpret and evaluate count data Written for researchers with little or no background in advanced statistics the book presents treatments of all major models using numerous tables insets and detailed modeling suggestions It begins by demonstrating the fundamentals of modeling count data including a thorough presentation of the Poisson model It then works up to an analysis of the problem of overdispersion and of the negative binomial model and finally to the many variations that can be made to the base count models Examples in Stata R and SAS code enable readers to adapt models for their own purposes making the text an ideal resource for researchers working in health ecology econometrics transportation and other fields

An Introduction to Generalized Linear Models Annette J. Dobson, Adrian Barnett, 2008-05-12 Continuing to emphasize numerical and graphical methods An Introduction to Generalized Linear Models Third Edition provides a cohesive framework for statistical modeling This new edition of a bestseller has been updated with Stata R and WinBUGS code as well as three new chapters on Bayesian analysis Like its predecessor this edition presents the theoretical background of generalized linear models GLMs before focusing on methods for analyzing particular kinds of data It covers normal Poisson and binomial distributions linear regression models classical estimation and model fitting methods and frequentist methods of statistical inference After forming this foundation the authors explore multiple linear regression analysis of variance ANOVA logistic regression log linear models survival analysis multilevel modeling Bayesian models and Markov chain Monte Carlo MCMC methods Using popular statistical software programs this concise and accessible text illustrates practical approaches to estimation model fitting and model comparisons It includes examples and exercises with complete data sets for nearly all the models covered
