Dynamics of Nonlinear Time-Delay Systems Muthusamy Lakshmanan, Dharmapuri Vijayan Senthilkumar, 2011-01-04

Synchronization of chaotic systems a patently nonlinear phenomenon has emerged as a highly active interdisciplinary research topic at the interface of physics biology applied mathematics and engineering sciences In this connection time delay systems described by delay differential equations have developed as particularly suitable tools for modeling specific dynamical systems Indeed time delay is ubiquitous in many physical systems for example due to finite switching speeds of amplifiers in electronic circuits finite lengths of vehicles in traffic flows finite signal propagation times in biological networks and circuits and quite generally whenever memory effects are relevant This monograph presents the basics of chaotic time delay systems and their synchronization with an emphasis on the effects of time delay feedback which give rise to new collective dynamics Special attention is devoted to scalar chaotic hyperchaotic time delay systems and some higher order models occurring in different branches of science and technology as well as to the synchronization of their coupled versions Last but not least the presentation as a whole strives for a balance between the necessary mathematical description of the basics and the detailed presentation of real world applications

Electronic Modelling of Deterministic and Stochastic Oscillators Vladimir Semenov, 2025-01-28 This book presents advanced methods for the electronic modeling of dynamical systems governed by ordinary differential equations It offers a comprehensive toolkit and practical solutions for specialists in nonlinear dynamics who seek experimental validation of their mathematical models The aim is to empower readers without an extensive background in electronics or circuit theory to translate their theoretical concepts into real world devices facilitating the rapid experimental confirmation of numerical and theoretical findings For experts in electronic engineering the book showcases how a wide range of non electronic systems and their unique characteristics can be effectively modeled using electronic circuits Bridging the gap between theory and practice the book serves as a valuable resource on electronics for theorists and mathematicians and on nonlinear dynamics for experimentalists and engineers Its audience includes a broad spectrum of readers from students and engineers to scientists and researchers across various fields

Nonlinear Analysis in Neuroscience and Behavioral Research Tobias A. Mattei, 2016-10-31 Although nonlinear dynamics have been mastered by physicists and mathematicians for a long time as most physical systems are inherently nonlinear in nature the recent successful application of nonlinear methods to modeling and predicting several evolutionary ecological physiological and biochemical processes has generated great interest and enthusiasm among researchers in computational neuroscience and cognitive psychology Additionally in the last years it has been demonstrated that nonlinear analysis can be successfully used to model not only basic cellular and molecular data but also complex cognitive processes and behavioral interactions The theoretical features of nonlinear systems such unstable periodic orbits period doubling bifurcations and phase space dynamics have already been successfully applied by several research groups to analyze the behavior of a variety of neuronal

and cognitive processes. Additionally, the concept of strange attractors has led to a new understanding of information processing which considers higher cognitive functions such as language, attention, memory, and decision making as complex systems emerging from the dynamic interaction between parallel streams of information flowing between highly interconnected neuronal clusters organized in a widely distributed circuit and modulated by key central nodes. Furthermore, the paradigm of self-organization derived from the nonlinear dynamics theory has offered an interesting account of the phenomenon of emergence of new complex cognitive structures from random and non-deterministic patterns, similarly to what has been previously observed in nonlinear studies of fluid dynamics. Finally, the challenges of coupling massive amounts of data related to brain function generated from new research fields in experimental neuroscience such as magnetoencephalography, optogenetics, and single-cell intra-operative recordings of neuronal activity have generated the necessity of new research strategies which incorporate complex pattern analysis as an important feature of their algorithms. Up to now, nonlinear dynamics has already been successfully employed to model both basic single and multiple neurons' activity such as single-cell firing patterns, neural networks, synchronization, autonomic activity, electroencephalographic measurements, and noise modulation in the cerebellum, as well as higher cognitive functions and complex psychiatric disorders. Similarly, previous experimental studies have suggested that several cognitive functions can be successfully modeled with basis on the transient activity of large-scale brain networks in the presence of noise. Such studies have demonstrated that it is possible to represent typical decision-making paradigms of neuroeconomics by dynamic models governed by ordinary differential equations with a finite number of possibilities at the decision points and basic heuristic rules which incorporate variable degrees of uncertainty. This e-book has included frontline research in computational neuroscience and cognitive psychology involving applications of nonlinear analysis, especially regarding the representation and modeling of complex neural and cognitive systems. Several expert teams around the world have provided frontline theoretical and experimental contributions as well as reviews, perspectives, and commentaries in the fields of nonlinear modeling of cognitive systems, chaotic dynamics in computational neuroscience, fractal analysis of biological brain data, nonlinear dynamics in neural networks, research on nonlinear and fuzzy logics in complex neural systems, nonlinear analysis of psychiatric disorders, and dynamic modeling of sensorimotor coordination. Rather than a comprehensive compilation of the possible topics in neuroscience and cognitive research to which non-linear may be used, this e-book intends to provide some illustrative examples of the broad range of
