**The Fuse Element** The fuse element is the most critical component of a fuse as it is responsible for carrying the current and melting when an overcurrent occurs It is typically made of zinc copper or silver which are good conductors of electricity and have a low melting point The diameter of the fuse element is designed to be smaller than the rest of the circuit allowing it to heat up quickly and melt when the current exceeds its rating The cross sectional area and material of the fuse element determine the amount of current it can handle before melting

**The Fuse Body** The fuse body is the cylindrical or blade shaped casing that houses the fuse element It is usually made of glass ceramic plastic or Bakelite which are non conductive materials
