Security Compliance in Model-driven Development of Software Systems in Presence of Long-Term Evolution and Variants Sven Matthias Peldszus, 2022-07-13 For ensuring a software system's security it is vital to keep up with changing security precautions attacks and mitigations Although model based development enables addressing security already at design time design models are often inconsistent with the implementation or among themselves An additional burden are variants of software systems To ensure security in this context we present an approach based on continuous automated change propagation allowing security experts to specify security requirements on the most suitable system representation We automatically check all system representations against these requirements and provide security preserving refactorings for preserving security compliance For both we show the application to variant rich software systems To support legacy systems we allow to reverse engineer variability aware UML models and semi automatically map existing design models to the implementation Besides evaluations of the individual contributions we demonstrate the approach in two open source case studies the iTrust electronics health records system and the Eclipse Secure Storage
