Flores,2001 Learn the newest processing techniques for focusing radar images with this important new book It helps you master the SAR ISAR fundamentals that are critical to understanding motion compensation and advanced SAR ISAR imaging techniques and gives you the background you need to tackle problems such as estimating motion parameters by phase analysis compensating the phase of a wideband signal and processing a wideband signal into a radar image      **Polarimetric Doppler Weather Radar** V. N. Bringi,V. Chandrasekar,2001-08-30 This 2001 book provides a detailed introduction to the principles of Doppler and polarimetric radar focusing in particular on their use in the analysis of weather systems The design features and operation of practical radar

systems are highlighted throughout the book in order to illustrate important theoretical foundations. The authors begin by discussing background topics such as electromagnetic scattering, polarization and wave propagation. They then deal in detail with the engineering aspects of pulsed Doppler polarimetric radar, including the relevant signal theory, spectral estimation techniques and noise considerations. They close by examining a range of key applications in meteorology and remote sensing. The book will be of great use to graduate students of electrical engineering and atmospheric science as well as to practitioners involved in the applications of polarimetric radar systems.

**The Feasibility of Detecting Shock Waves by Pulse Doppler Radar** Kenneth M. Glover, 1966. Classical geometric optics estimates of the echo characteristics from both isotropic and directed acoustic shocks are presented together with the detection capability of a typical sensitive pulse Doppler radar. AFCRL Porcupine Doppler in order to determine the feasibility of detecting large well defined boundaries of refractive index. Both the radar cross section and the Doppler spectrum of an acoustic shock are sensitive to wind and temperature induced perturbations of the shock surface. For standard deviations in wind and temperature of 0.5 m/sec and 1°C the theoretical values of the maximum radar cross section and minimum Doppler spectral width of a typical directed shock of 50 meters radius are found to be 0.0008 sq cm and 58 cps respectively. This target cross section is about 6 dB stronger than the minimum cross section detectable by the Porcupine radar at a range of only 1.8 kilometers. At this range the presence of a weak signal may be completely masked by the presence of strong ground clutter signals. Signal processing techniques which improve the mean square to noise ratio and provide sub-clutter visibility are therefore crucial to the success of the experiment. Moreover the sensitivity of the radar cross section and the Doppler spectrum to wind and temperature perturbations restricts the experiments to calm conditions.
